CFG DEGREE - FULLSTACK - GROUP ONE

PLANT PAL

FIND YOUR SOILMATE

OUR IDEA

Concept / What we are building

We propose to create a web app that functions similarly to a dating app, but instead of matching users with other users, it matches them with houseplants perfectly suited to their lifestyle, environment and preferences. Users answer a playful personality questionnaire (e.g How much commitment are you looking for? Do you want something clingy?) The app will then generate up to 20 plant matches displayed as a gallery. Users can then like or pass on plants until they are left with their top matches.

Project features will Include:

- Landing page - one tab how it works, one tab start
- A multi step questionnaire
- A filter system for the plant API we will be using
- A gallery that can be swiped / selected into yes and no
- A final shortlist of the plant matches
- Plant care profiles for each of the final matches
- Optional - save favorites with login, create plant care schedule

Who this will help

- Beginner plant owners who want guidance
- People who want plants but don't know where to start
- Pet owners who need non-toxic plant recommendations
- People who enjoy a more fun, gamified approach to making decisions

WORKFLOW

Tools we will be using

- Notion - Task organisation
- Slack - Team communication
- VS Code - Main coding environment
- GitHub - Version control
- Excalidraw / Figma - Wireframe design
- Perenual - Plant API
- Postman - API Testing

Meetings and planning

- We will be meeting after each of the CFG sessions to touch base and plan next steps
- At the end of each meeting notes will be compiled and actions will be assigned as tasks to the relevant team member.

BRANDING

Potential Names

- Soilmate - play on soulmate
- Rootr - are you ready to put down roots?
- Sprout Right - play on swipe right
- Love + Plants

Taglines

- Grow your perfect green flag, zero toxicity, healthy roots guaranteed.
- Find a perfect companion that grows with you… one leaf at a time.
- A match for your windowsill, that you won't want to kill.
- Grow Your Love.
- Let Love Grow.
- Plant one on me.

Design

The app will use a fun retro, girly dating-show theme to make choosing plants feel light, playful and easy. The style takes inspiration from old-school matchmaking shows, using soft colours, bold fonts, hearts and a dash of humour.

This signifies to users that the app isn’t serious or intimidating, it’s a relaxed, feel-good way to find the right plant.

The dating-show angle fits with yes/no match feature, helping users understand the process quickly. It turns plant traits into simple, personality-based profiles that are easy to compare and fun to read.

COLOURS

Colour choices

We have chosen a palette of greens and pinks with a highlight of retro yellow because it feels fun, nostalgic and fits with our dating-show theme.
The colours work well together and we have checked all combinations for accessibility and clear contrast.

Accessible color combinations

Please don't use these color combinations; they do not meet a color contrast ratio of 4.5:1, so they do not conform with the standards of Section 508 for body text. This means that some people would have difficulty reading the text. Employing accessibility best practices improves the user experience for all users.

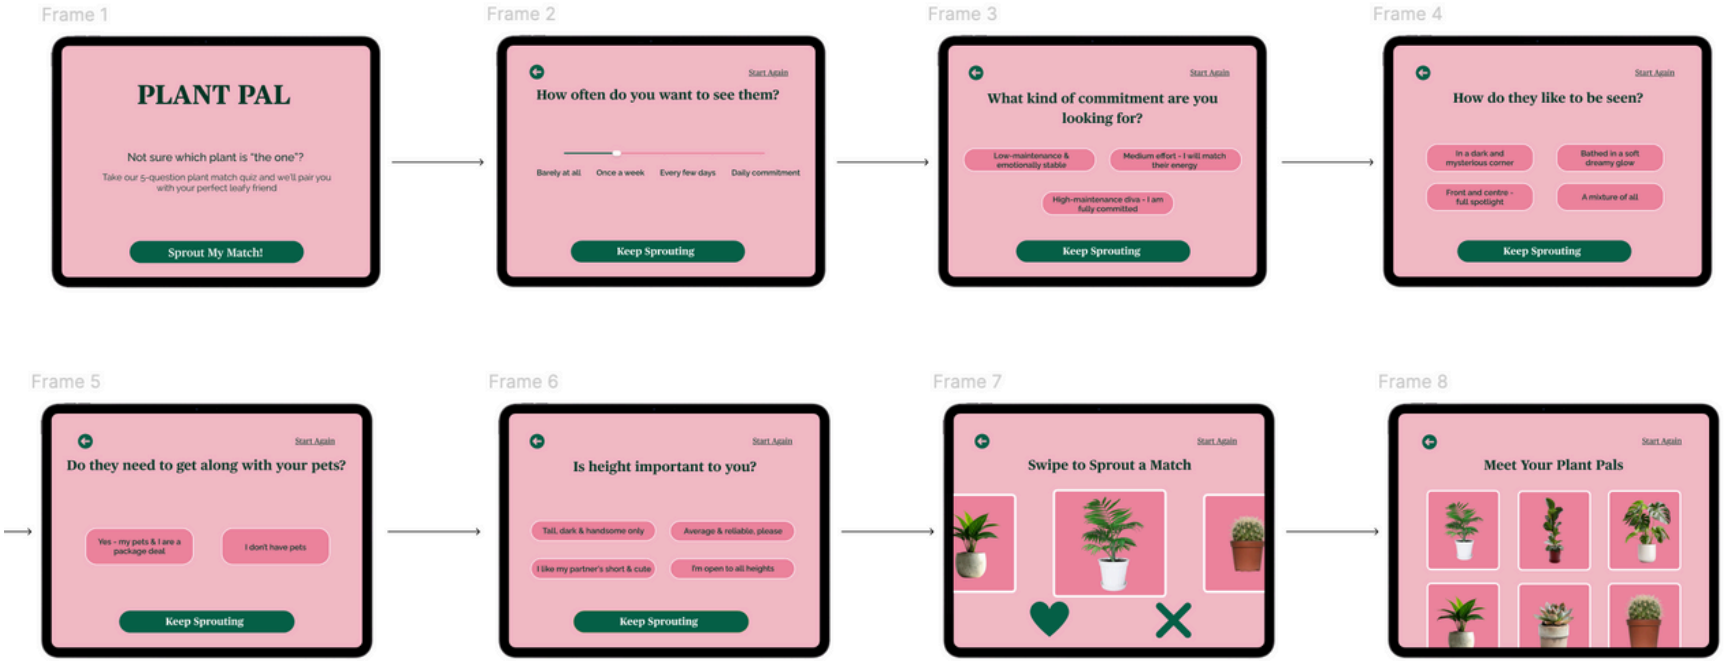
WIREFRAME



View on Figma →

The layout is designed to make the user journey simple, clear and aligned with the dating-style theme of the app. It starts with the questionnaire, helping users share their preferences before seeing any plant options. The swipe-card layout keeps the experience interactive and playful, similar to a dating app. Each screen naturally leads to the next, making the flow easy to follow, especially for beginners. Clear buttons and a strong visual hierarchy keep everything accessible and user-friendly, supporting our goal of making plant-matching feel fun.

PLANT API

Perenual Plant API

We will use the Perenual Plant API to generate personalised plant recommendations based on the user's answers. The first set of questions allows us to build the basic filter parameters (watering, sunlight, hardiness), which we then send to the species-list endpoint to get an initial group of suitable plants. We only make this call once all questions are answered, so users can change their responses without triggering multiple requests and so we stay within the API's daily limits.

Once we receive the initial plant list, the final two questions help us refine the results using the species-details endpoint. We loop through each plant ID returned from the first call, fetch the full details, and then filter based on toxicity, size, and image availability. This gives us a final curated list that can be displayed on the swipe and gallery pages. To improve performance and prevent repeat API usage, we plan to store filter parameters and plant arrays using localStorage and Redux so the data persists even if the user goes back or refreshes the page.
